WATER-RELATED ENVIRONMENTAL PLANNING

by

George J. Sloss
Director of Research
Environmental Planning and Design
One Hundred Ross Street
Pittsburgh, Pennsylvania, 15219

INTRODUCTION

This bibliography is a result of several water-oriented planning projects undertaken by Environmental Planning and Design. One, in New York State, involved developing environmental guidelines for ninety miles of Lake Ontario shoreline. Another, in Florida, sought to maintain the fragile ecology of a barrier island while providing for residential development under stringent regulation. The primary emphasis is on fresh rather than saltwater areas.

Entries are listed by general subject heading.

The number listed at the end of the entry indicates where the address may be found in the "List of Publishers" section.

Where available, the cost of U. S. Government Printing Office and National Technical Information Service publications have been listed since these agencies require prepayment.

RIVER BASINS

"The River Basin Model," is a computer-assisted decision making tool that helps illustrate the comprehensive environment in which water resource decisions are made. Through its two major components-human interaction and computer simulation-the model allows users to represent the major economic, social, and government interests that cause a regional system to function and change. Water is used by all the private activities in the model, and many of the physical features of water are represented (volume, rate and direction of flow, flooding probabilities, etc.). Pollution is measured, and its impacts on the rest of the system are represented. Hazards to health (dollar costs and time lost) and to the physical environment from pollution and flooding are included in the model. Water quantity and quality is also represented. Publications comprising the model are as follows (U. S. Government Printing Office, 47):

"An Overview," 1972, SN 5501-0313, $1.00.
